5.8W AUDIO POWER AMPLIFIER

CAR STEREO CAR RADIO AUDIO OUTPUT

- Very Few External Parts (Require 4 PCS Capacitor)
- Adjustable Closed-Loop Gain
- High Sustaining Over Voltage
  (Surge voltage up to 40V for 0.2sec. pin 1 to 8)
- Excellent Ripple Rejection
- High Power and Low Distortion :
  P_{OUT}=5.8W(Typ.) at V_{CC}=13.2V, R_L=4Ω, THD=10%
  THD=0.2%(Typ.)
- Possible to Use for 2Ω Load :
  P_{OUT}=9.3W(Typ.) at V_{CC}=13.2V, THD=10%
- Operating Supply Voltage Range : V_{CC}=8 ~ 18V
- Audio Muting Circuit
- Protection Circuit (for Load Short, Excessive Supply Voltage and Thermal Shut-down)

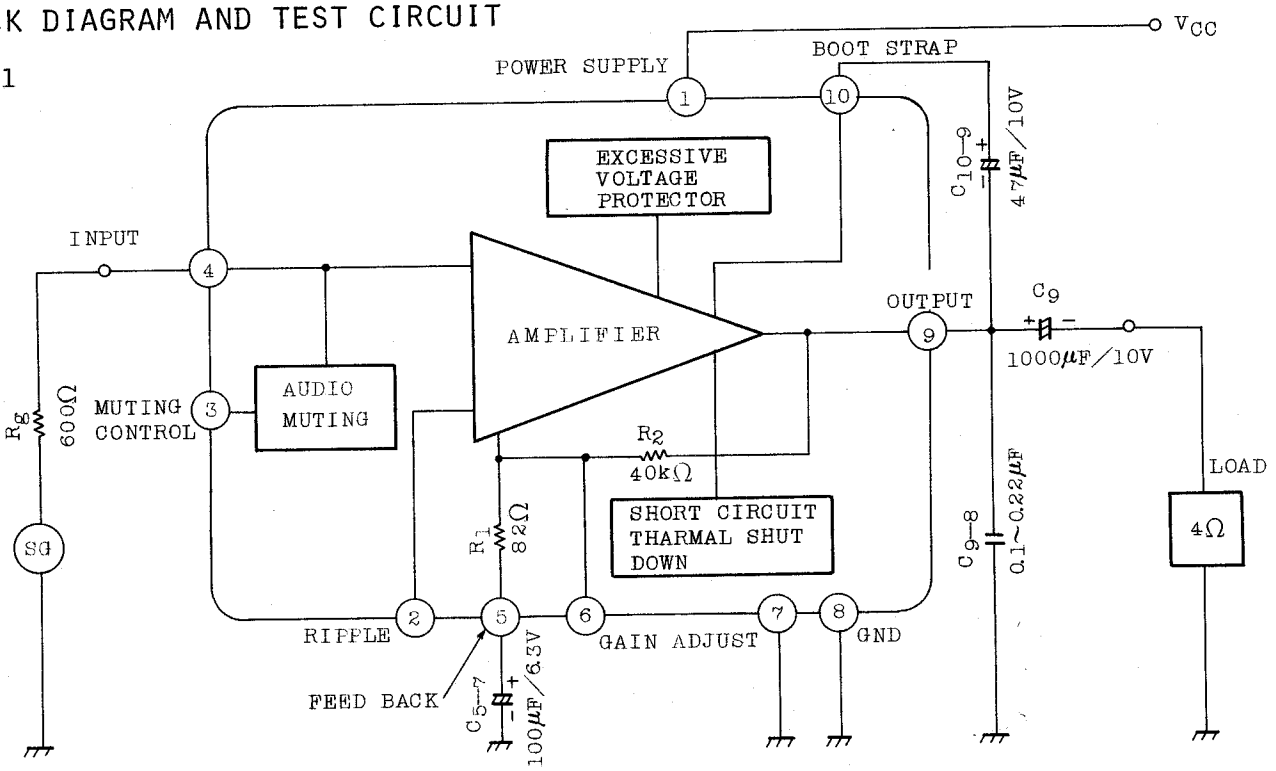
BLOCK DIAGRAM AND TEST CIRCUIT

FIG-1



1. Terminal ⑦ is input stage GND, terminal ⑧ is output stage GND.

2. Closed-loop voltage gain of the amplifier is determined by the ratio ; $(R_1+R_2)/R_1$. TA7222AP is fixed at typically 53.0 dB for designing minimum external components.

   . When higher closed loop gain is desired, the gain can be increased by connecting a resistor between pin ⑤ and pin ⑥ . Open loop gain is obtained by shortening pin ⑤ and pin ⑥ .
   . When lower closed loop gain is desired, the following two ways can be used.
   A. Series connecting a resistor and a capacitor between pin ⑥ and pin ⑨ .
   B. Series adding a resistor to pin ⑤.

   Both A and B, lower closed loop gain than 40 dB is not recommended. And also, ripple rejection ratio is decreased by using B configuration in such a case, connecting a capacitor from pin ② to ground is recommended.
   (Fig.2,3,4 show these ways.)

3. For applications requiring high ripple rejection ratio, an excellent supply voltage ripple rejection is obtained by connecting a capacitor (recommended value 4.7μF) between pin ② and ground.
   (R.R-f shows these characteristics)

4. Terminal ③ is Audio Muting Control Input.
   . When control input is low state (; open or below 0.3V), muting circuit does not operate, OFF.
   . When control input is high state (; above 1.0V), muting circuit, then, operates, ON. (Refer to Fig.5)
